[F/AI × Notion]

From company context to AI that gets work done.

Sylvain Ramaradjou · Rama Logic · 3 Nov 2026

Rama Logic

STATION F

[the idea in one line]

Notion is the context of your business.

[the problem]

Every AI you use starts from zero about your company.

[the cost]

So you explain your company again. And again. And again.

We are a B2B startup that...

We are a B2B startup that...

We are a B2B startup that...

[in the chat]

What did you have to re-explain to an AI this week?

[the shift]

Models stopped being the bottleneck. Context did not.

[the habit]

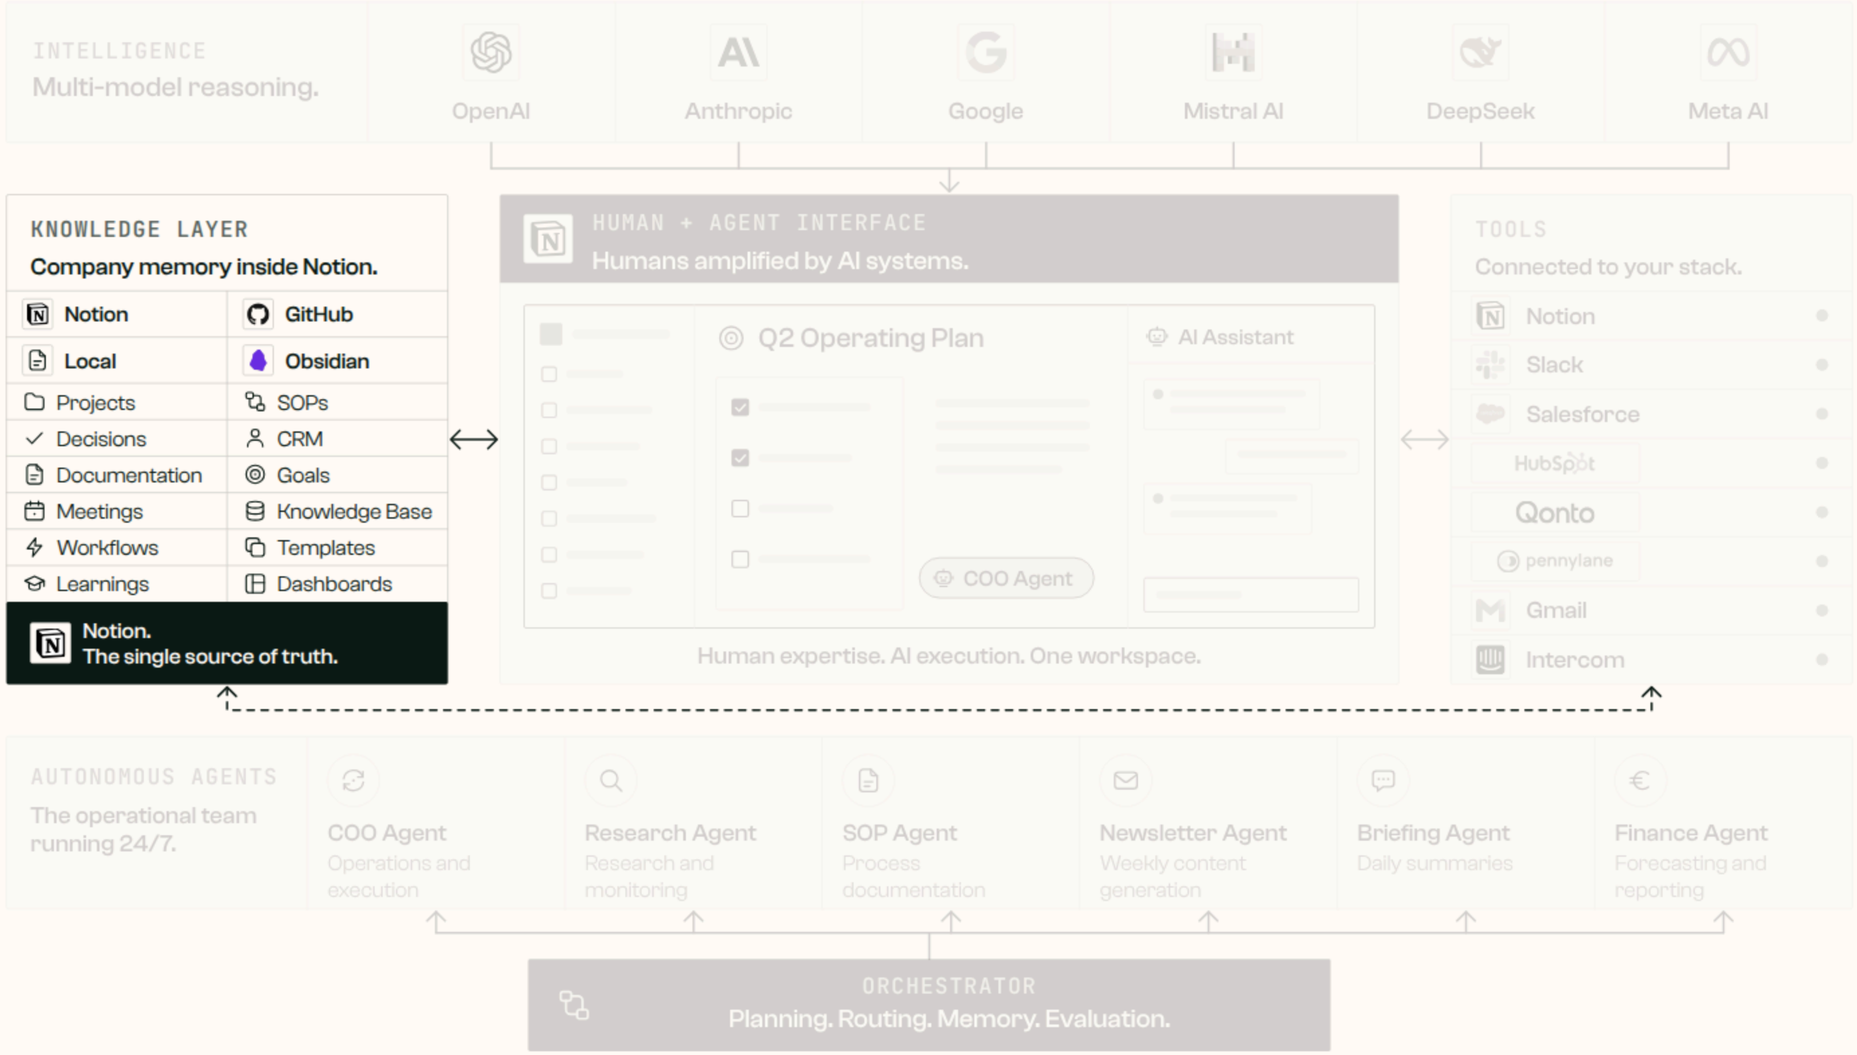

Write your company down once. Let every AI read it.

[the culture angle]

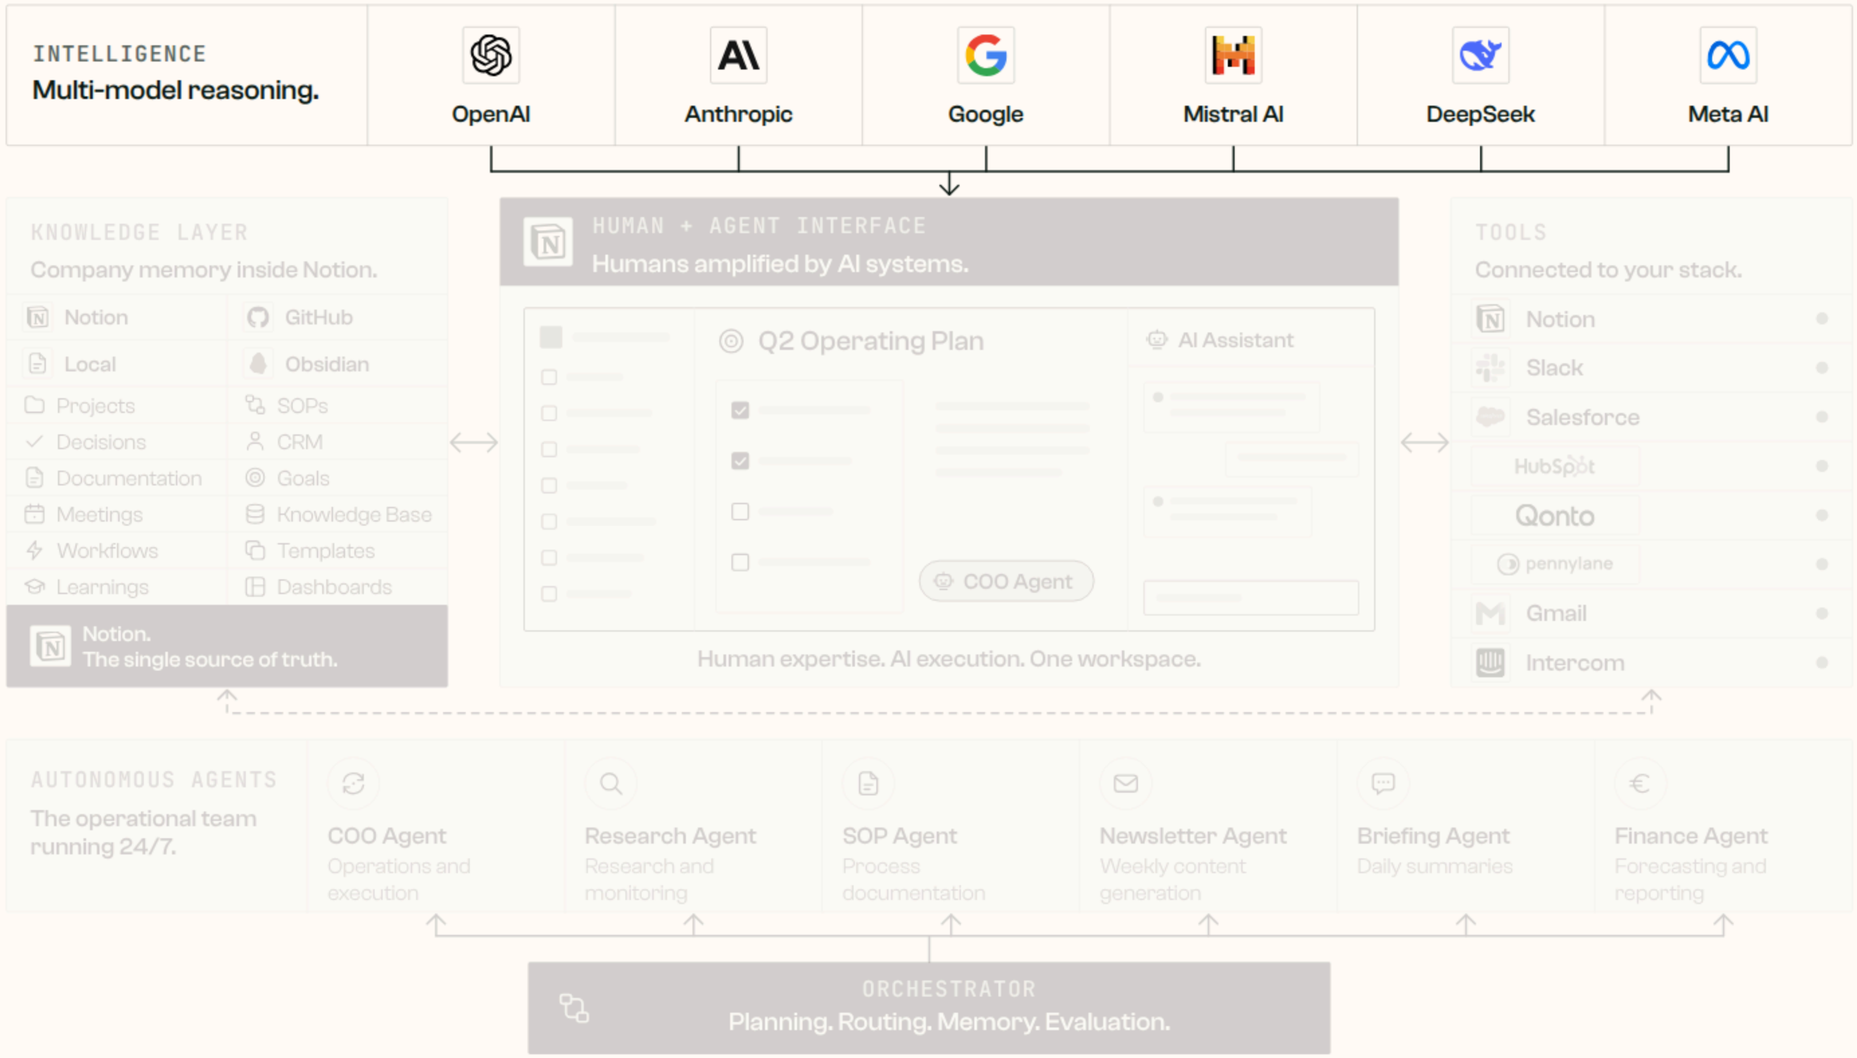

Your written culture becomes your AI's context.

[the architecture · memory]

It starts with your company's memory, in Notion.

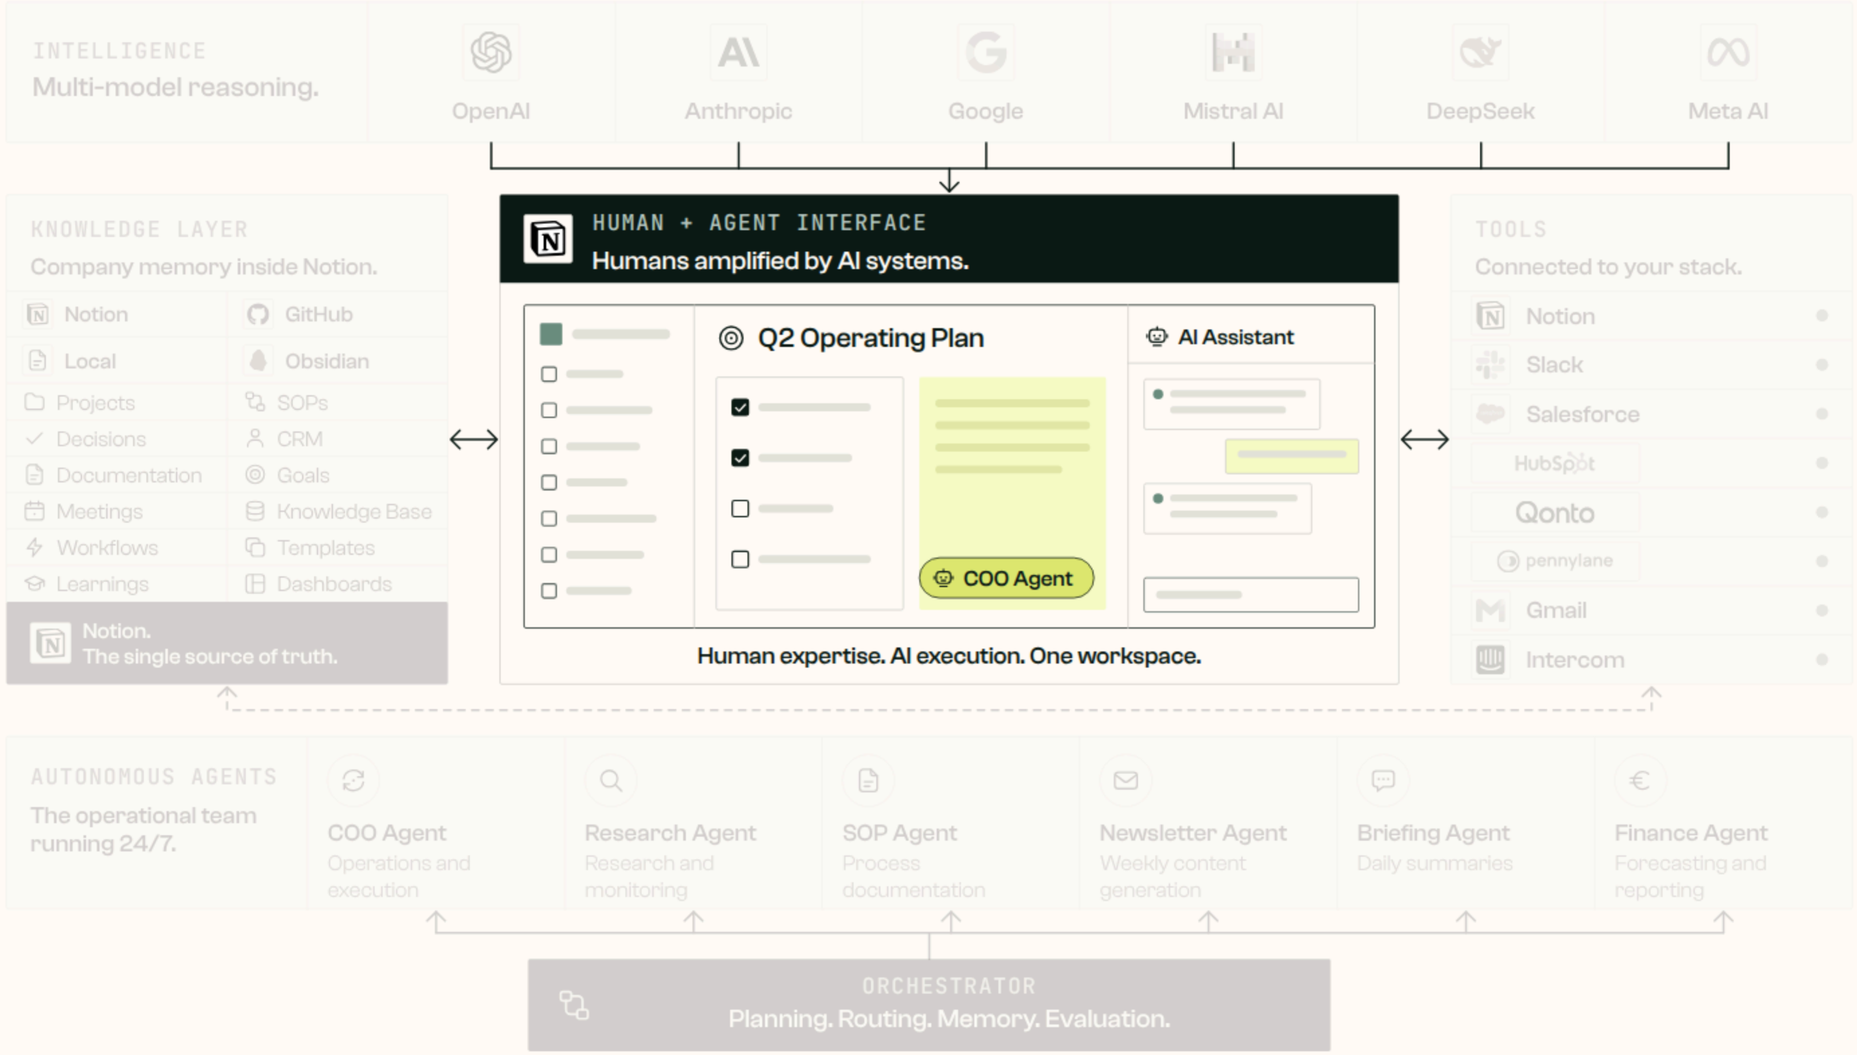

On top, the models. Several, not one.

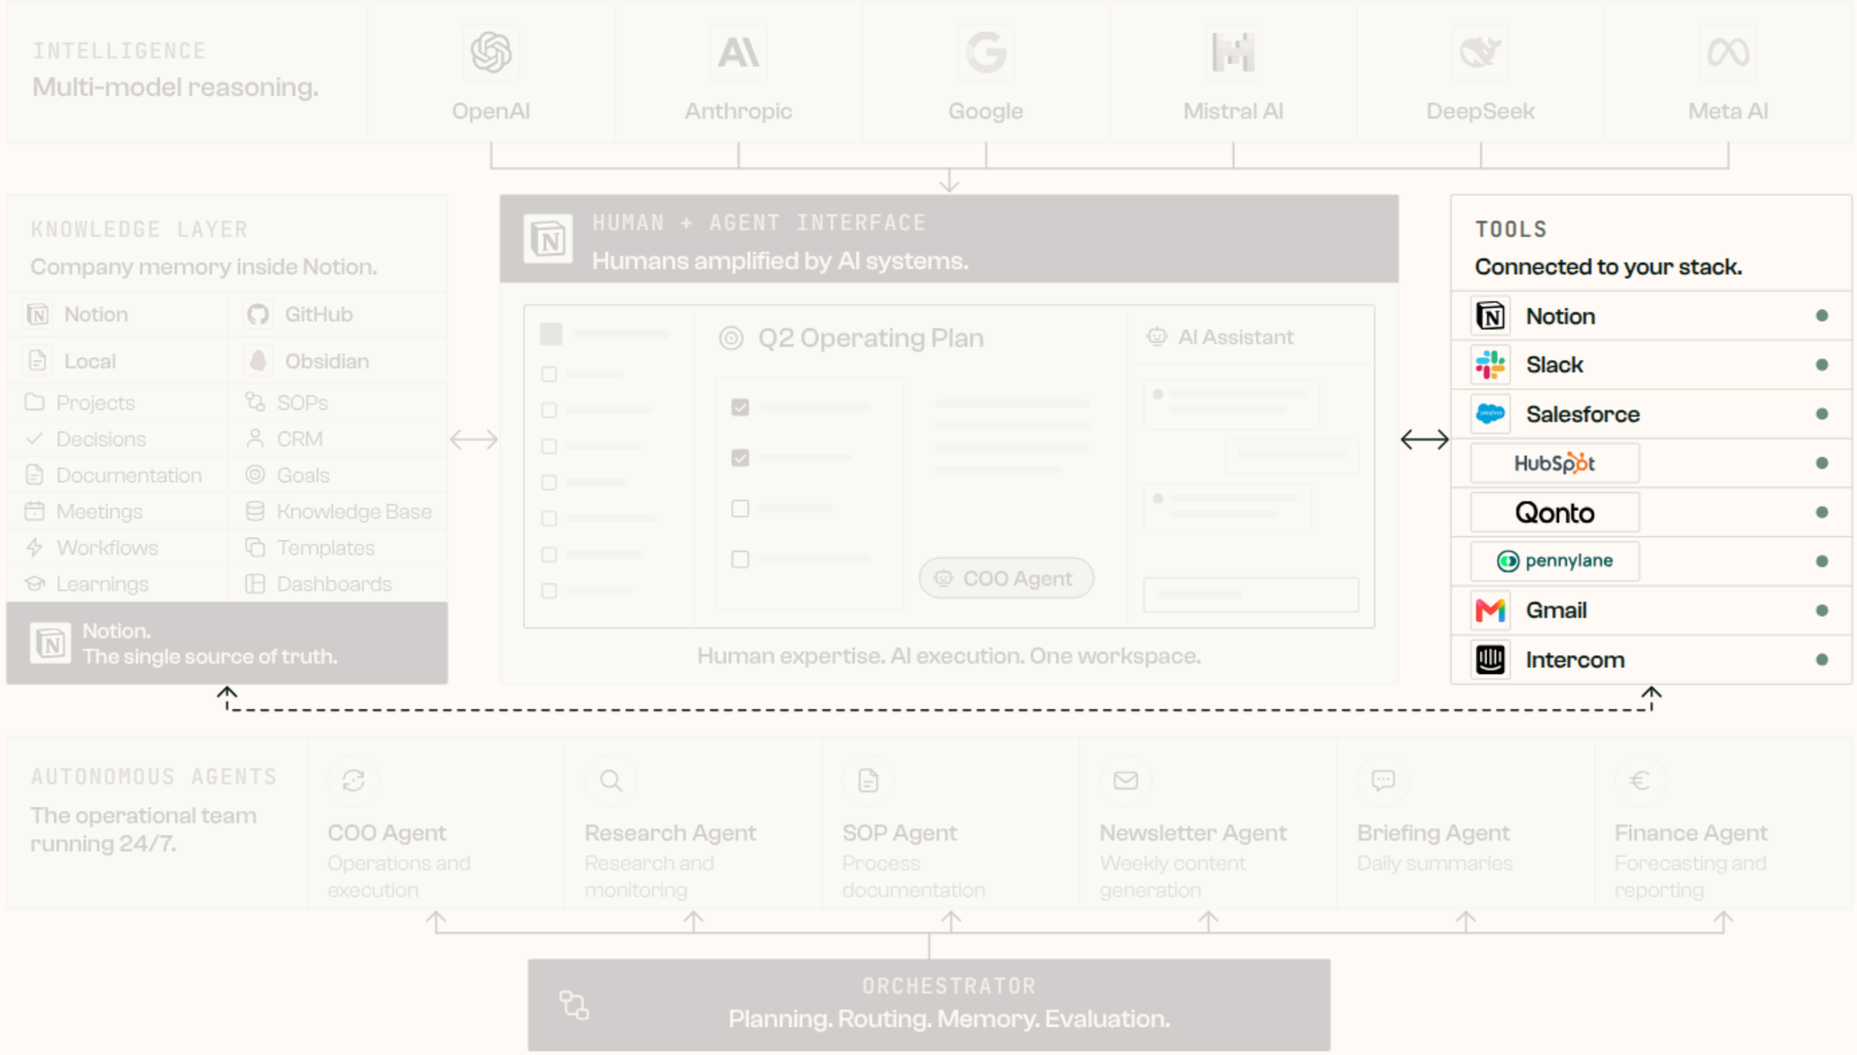

[the architecture · interface]

In the middle, one workspace for humans and agents.

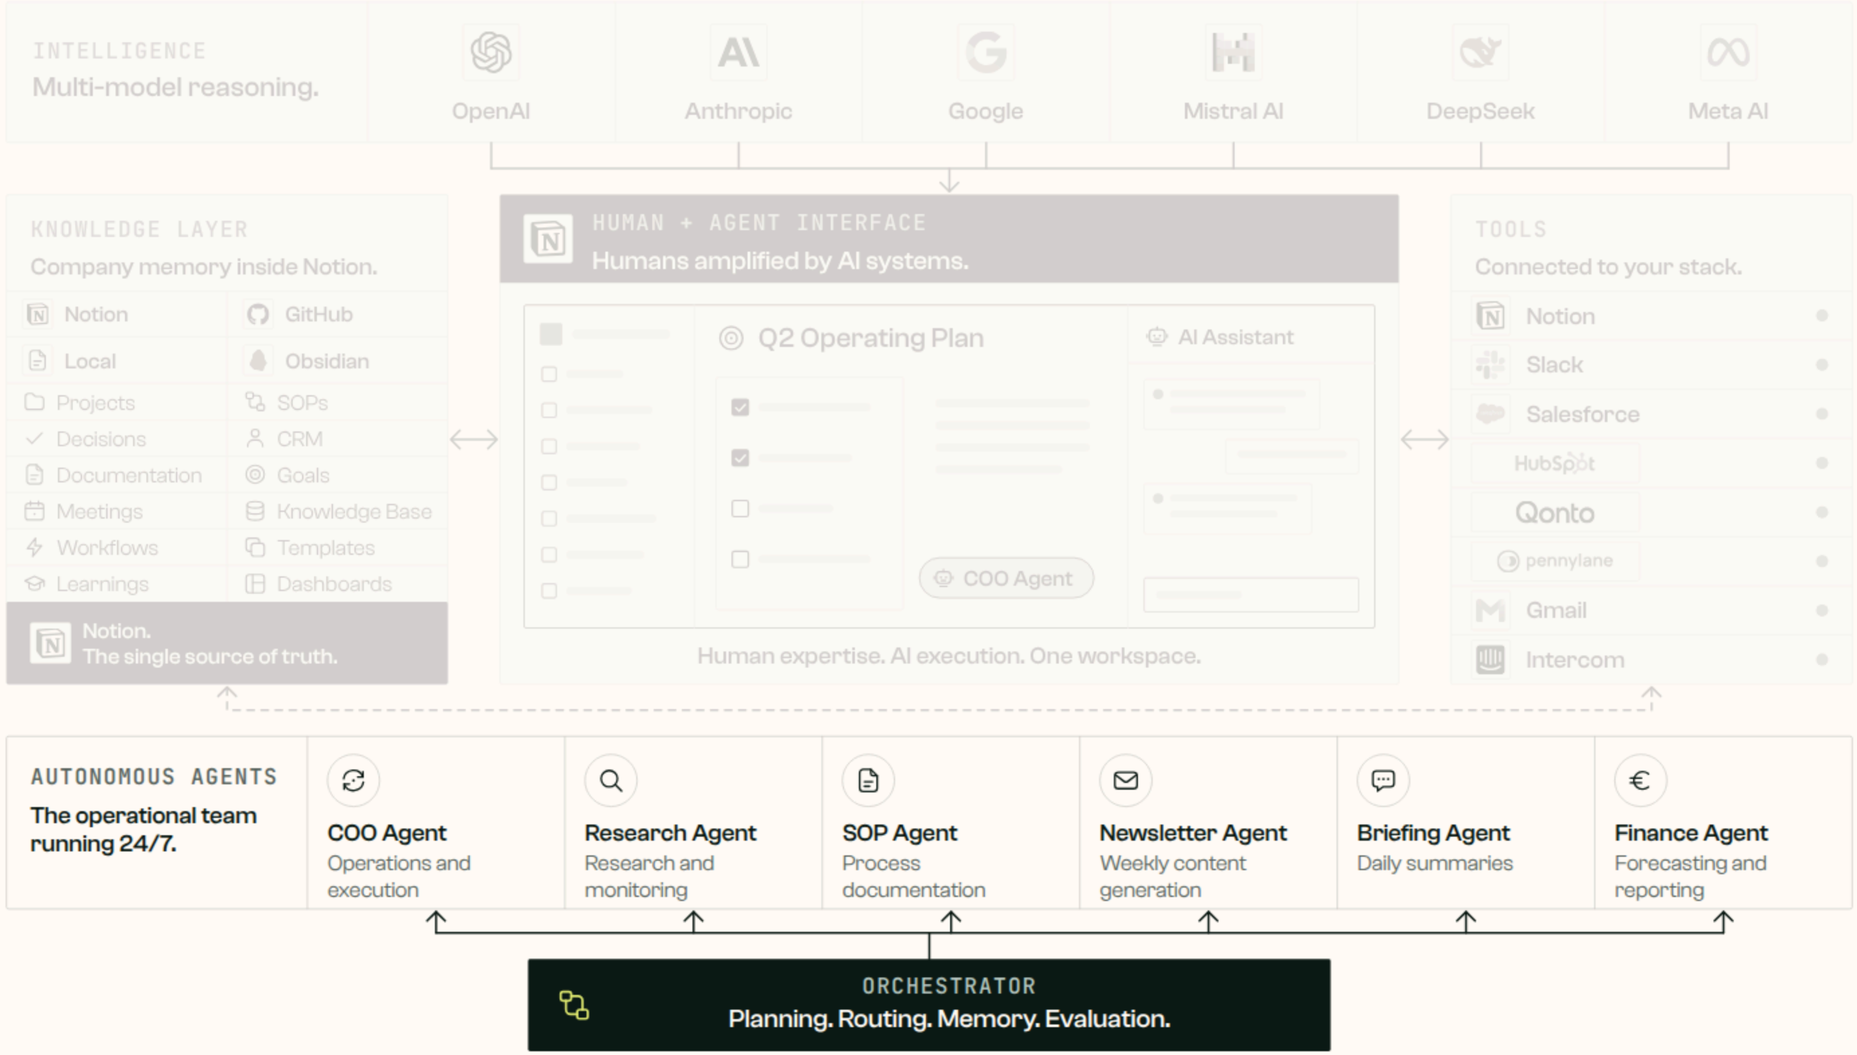

On the right, the tools you already use.

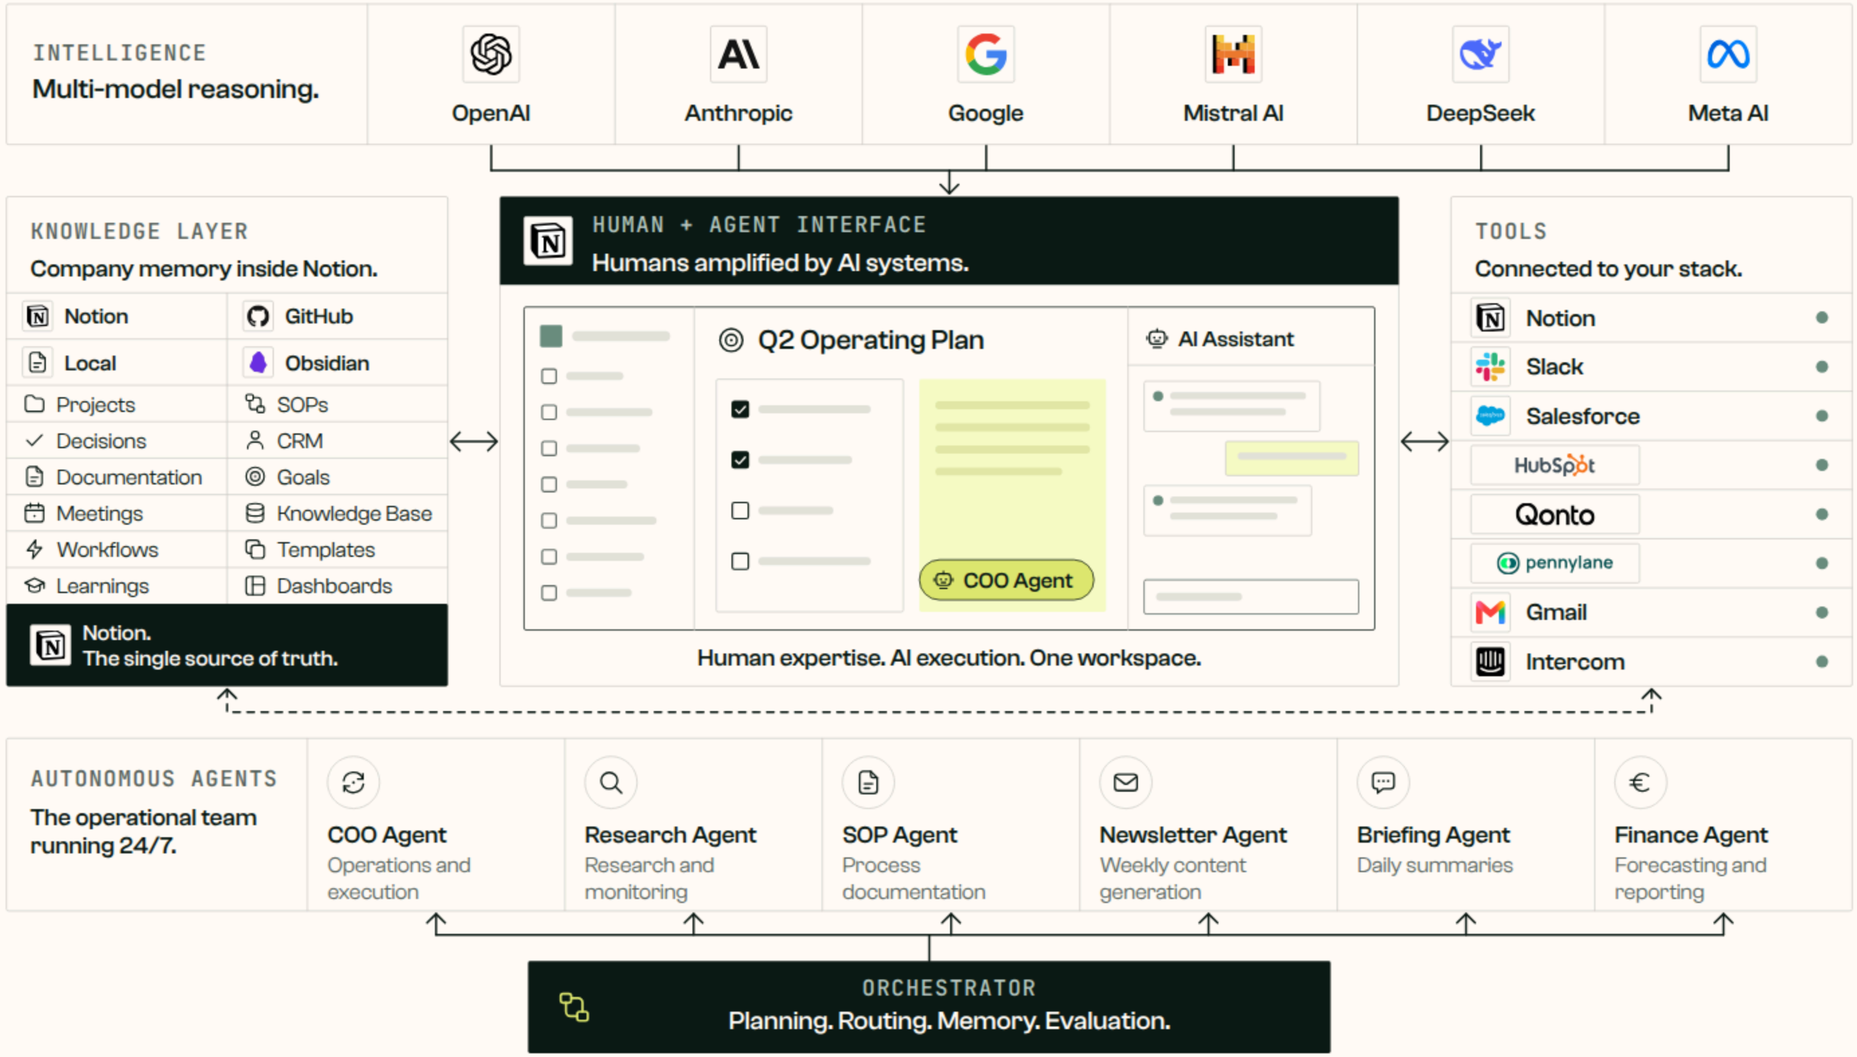

[the architecture · agents]

Below, the agents. One orchestrator routes the work.

[the architecture]

AI is not a model. It's a system.

[proof · rama logic]

I run my own company this way.

my AI's instructions file · rewritten from notion every night at 05:00

[every night]

Every night, my Notion is copied into my AI's memory.

[in numbers]

56 databases. 66 robots. One source of truth.

[the result]

My robots never ask me who my customers are.

[day one]

Five pages. That's all you need on day one.

01 mission & strategy	02 customers	03 offer & product	04 ways of working	05 language & principles	+ read me first

Why you exist, and what you refuse to do.

company context / mission

Mission

What this page is for: the why behind every trade-off. An AI reads it before any answer that involves a choice.

Why we exist

When a sync fails, nobody is told. Vela exists so the person who owns a number knows it broke before anyone downstream does.

What we refuse to do

- **Copy customer rows.** Rows stay in the customer's warehouse.
- **Build another dashboard.** We tell people what broke where they already are.
- **Build for one customer.** A request waits until three customers ask for it.

Three bets, to October 2027

- **The operations buyer.** 30 paying accounts and 500,000 dollars ARR.

vela ai · demo workspace · fictional data

Who you serve, in their own words.

company context / customers

Customers

What this page is for: who buys from us, in their own words, and who does not. An AI reads it before writing anything a prospect will see.

Their words

> "I do not want another dashboard. I want one email on Monday telling me what broke." Bluepine Logistics, June 2026

> "It failed on the Tuesday. We found out on the Friday, from our own customer." Northwind Robotics, August 2026

> "I cannot take a number to my CFO when I do not know what triggers a charge." Arcadia Retail, July 2026

Not a customer

- Teams that want charts or a BI tool. We send alerts and a digest; we do not draw charts.

vela ai · demo workspace · fictional data

What you sell, what it costs, and what it never does.

company context / offer and product

Offer and product

What this page is for: what we sell, how it is priced, and what it does not do. An AI reads it before any answer about a price.

How it is priced

Plan	One flat annual price, set by the number of connected sources. Checks are unlimited.
Seats	Editors pay. Read-only teammates are free and unlimited.
Way in	A free 30-day pilot on the customer's warehouse, with one named owner.
Price grid	Not written yet. Ask Nadia Korb before quoting a number.

What it does not do

- **No dashboards, no charts.** Alerts and a digest, where people already are.
- **Not continuous.** Checks run after each sync. Never write "real-time".

vela ai · demo workspace · fictional data

How your team meets, decides and ships.

company context / rituals

Rituals

What this page is for: how the week runs, who decides what, and where things get written down.

Weekly meeting, Monday 9:30

- **Numbers, 5 min.** MRR, customers, pipeline and burn, from Metrics.
- **What customers said, 10 min.** New pages in Customer notes.
- **Decisions, 15 min.** Every Proposed row becomes Active, gets one question, or is deleted.

End of day

Before closing the laptop, everyone runs the same prompt: the day goes back into Notion. The AI writes, a human decides.

vela ai · demo workspace · fictional data

What you decided, and why.

company context / decisions

Decisions

All Active Proposed Reversed

Decision	Owner	Status	Why
Price plans by connected sources, flat per year	Nadia Korb	Active	A buyer can compute the annual number before the pilot ends.
Charge self-serve accounts per check run	Nadia Korb	Reversed	Reversed on 21 Sep 2026: buyers could not forecast the bill.
Sell to the head of operations	Nadia Korb	Active	The data team is the user, not the buyer.
Report failures in a Monday email digest	Dan Osei	Active	Ops leads do not open dashboards.
Publish a public status page for sync health	Dan Osei	Proposed	Two customers asked, during an incident, whose side failed.

vela ai · demo workspace · fictional data

The words you use, and the ones you ban.

company context / vocabulary

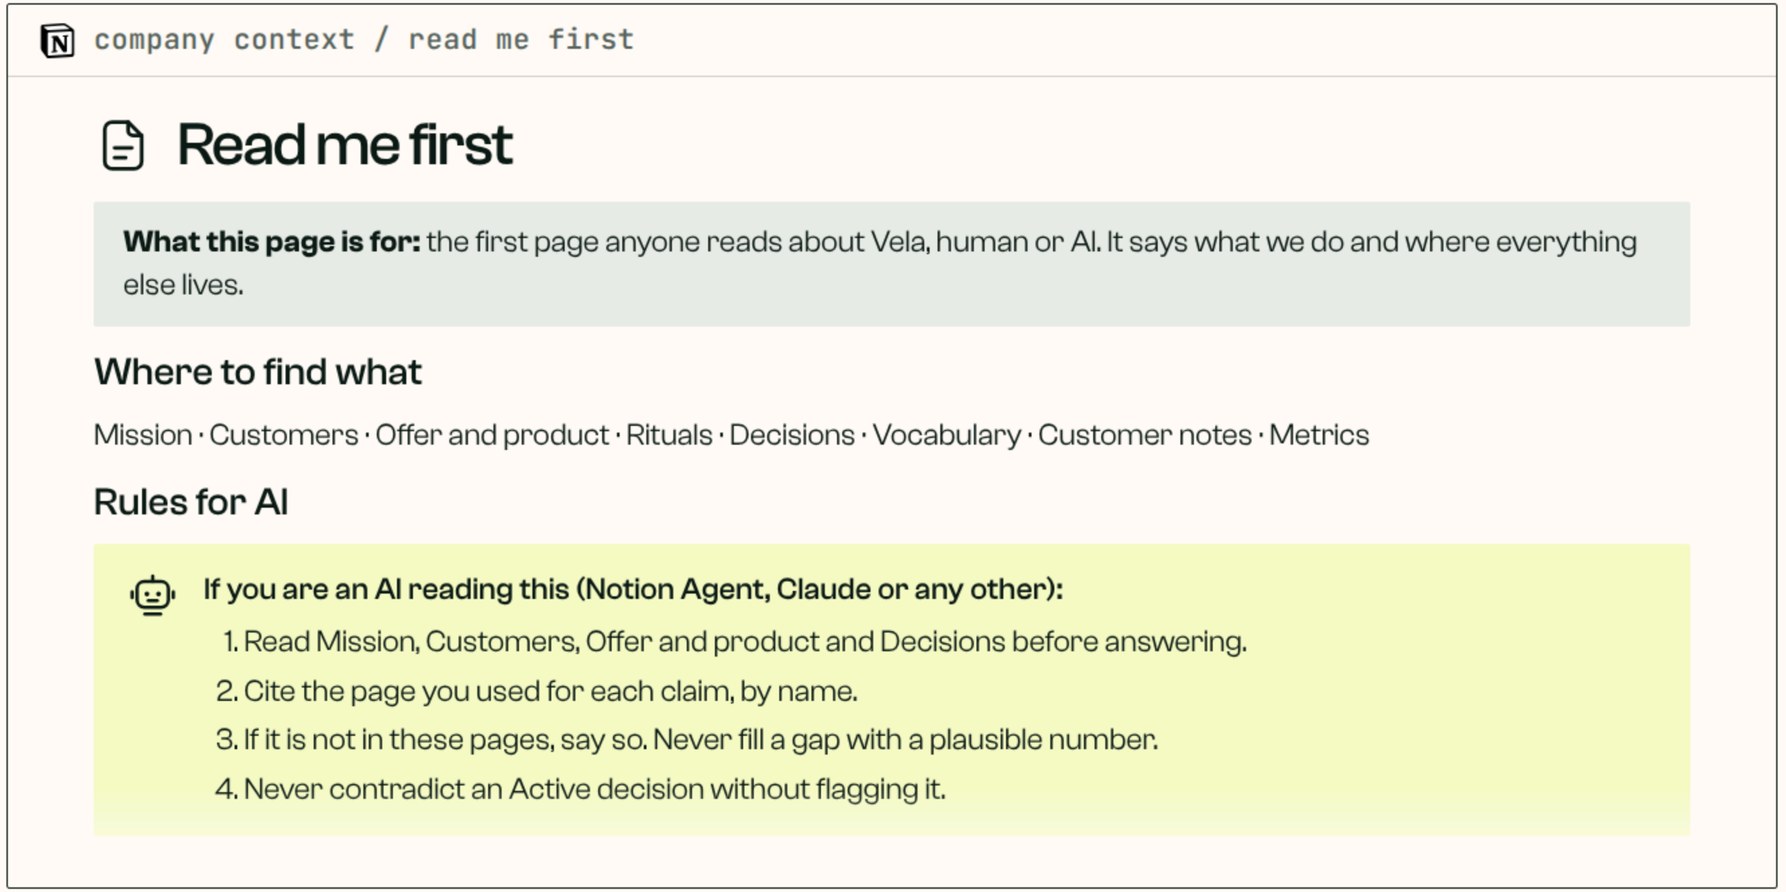

Vocabulary

Term	Use or ban	Meaning, or what to say instead
Pilot	Use	Free, with one named owner and an end date. Never call it a free trial.
Silent failure	Use	A failure nobody was told about. The problem we exist to end.
Real-time	Ban	Say “after every sync” or “within minutes of a failure”.
Seamless	Ban	Say what setup takes, with a number we measured.
AI-powered	Ban	Name the check: “checks row counts and freshness after every sync”.

vela ai · demo workspace · fictional data

[+ read me first]

One page that tells any human or AI where to start.

vela ai · demo workspace · fictional data

[live]

Let’s build it.

[two workers]

Same context. Two different workers.

notion custom agent

claude

[notion custom agent]

Lives in your workspace. Acts on your databases. Runs on its own.

[claude]

Sits next to you.
Plugs into your Notion.
Goes deep on one problem.

[use case 01 · custom agent]

A new hire asks how we decide. The workspace answers.

answer · tested with claude on the same pages

Who decides: Dan for product and ops, Nadia for pricing, go-to-market and hiring. A decision goes Proposed, then Active. Reversed rows are never deleted. Not written down yet: laptop, tool access, onboarding buddy. Ask Nadia or Dan.

[use case 02 · custom agent]

Three customer calls become two proposed decisions.

expected output · 2 rows added to decisions

Proposed · Post failure alerts to the customer's Slack or Teams channel the moment a sync fails. Source: 3 of 3 customer notes. Changes the Active decision "Monday email digest".

Proposed · Route each alert to the owner of the table. Source: 3 of 3 customer notes.

[use case 03 · claude]

October's investor update, written from your metrics.

claude · 199 words

Highlights: MRR 16,200, up 7.2% on September. Pipeline 98,000, up 26%.

Lowlights: customers flat at 9. Burn up for the fifth month running: 54,100.

Cash and runway are not in Metrics, so they are not in this update.

[use case 04 · claude]

A cold email that sounds like you, with zero banned words.

claude · 89 words · 0 banned word

When a sync fails at a logistics company, operations often hears last. One customer put it this way: "It failed on the Tuesday. We found out on the Friday, from our own customer." [...] When a stock number moves overnight, who finds out first today?

[use case 05 · custom agent]

Every Monday, last week's decisions land in one digest.

expected output · every monday 9:00

Decisions digest, week of 2 Nov 2026

Proposed: alerts in Slack or Teams · alerts to the table owner

Active: none new · Reversed: none

[use case 06 · claude]

Before you launch a free plan, Claude argues against it.

claude · every point cites a page

Against: it collides with three Active decisions (free 30-day pilots with a named owner, selling to the head of operations, one flat price per source). Burn is up five months running.

For: self-serve worked before.

Recommendation: no free plan. The free pilot stays the way in.

[use case 07 · claude]

Your landing page, checked against your own vocabulary.

claude

4 banned words caught: AI-powered, real-time, seamless, run. "Pay per run" contradicts the Active pricing decision.

Rewrite: Vela AI checks every table after each sync and emails the owner the moment a check fails. Stop finding out on Friday what broke on Tuesday.

[in the chat]

Which one would you hand to an agent first? Type 1 to 7.

1	A new hire asks how we decide. The workspace answers.	custom agent
2	Three customer calls become two proposed decisions.	custom agent
3	October’s investor update, written from your metrics.	claude
4	A cold email that sounds like you, with zero banned words.	claude
5	Every Monday, last week’s decisions land in one digest.	custom agent
6	Before you launch a free plan, Claude argues against it.	claude
7	Your landing page, checked against your own vocabulary.	claude

[rule of thumb]

Custom Agent for what repeats. Claude for what's new.

[the daily loop]

Read in the morning. Write it back at night.

01

morning

Every AI starts from Read me first. Nobody explains the company again.

02

all day

Work in any tool: Claude, a Custom Agent, your coding agent.

03

end of day

One prompt writes the day back into Notion: decisions, quotes, new words.

04

monday

The weekly meeting turns Proposed rows into Active decisions.

[end of day · the prompt]

One prompt, before you close the laptop.

prompt · claude or notion agent · also on rituals, in the template

Go through what we did today: this conversation, meeting notes and pages edited today.

Write it back into Notion: new decisions as Proposed rows in Decisions, customer quotes word for word in Customer notes, new words in Vocabulary.

Never mark a decision Active. Then list what you wrote, with links.

[your devs]

Let your devs pick any agent. Everything lands back in Notion.

01

read

Claude Code, Codex or Cursor reads Read me first and Decisions through the Notion MCP.

02

build

The code goes to git, as always. Nothing changes for the repo.

03

write back

What changed and why goes into Decisions, with the link to the pull request.

[copy this]

Code lives in git. The why lives in Notion.

agents.md for codex and cursor · same lines in claude.md for claude code

```
## Before any task

Read "Read me first" in Notion through the Notion MCP. Follow
its Rules for AI.

## When you finish

If the work changed how the product behaves, add a Proposed
row to Decisions: what, why, and the link to the pull request.
```

[this week]

Write your Read me first page. Then ask your AI one question.

[take it with you]

The starter template, and what I learn next.
